Wayfinder

Evidence-Backed Regulatory Intelligence And Action For
Ethiopian Businesses

W

Transparency & Accountability Track

THE PROBLEM

Businesses Discover Regulatory Obligations Too Late

Relevant information is fragmented across official pages, notices, directives, and scanned documents. Teams often investigate only when a bank, accountant, or filing deadline forces the question.

- Older authentic guidance remains searchable
- Applicability changes by date, audience, and transaction
- A publication rarely explains the next operational step

THE USER

Service Exporters Need Answers At The Transaction Moment

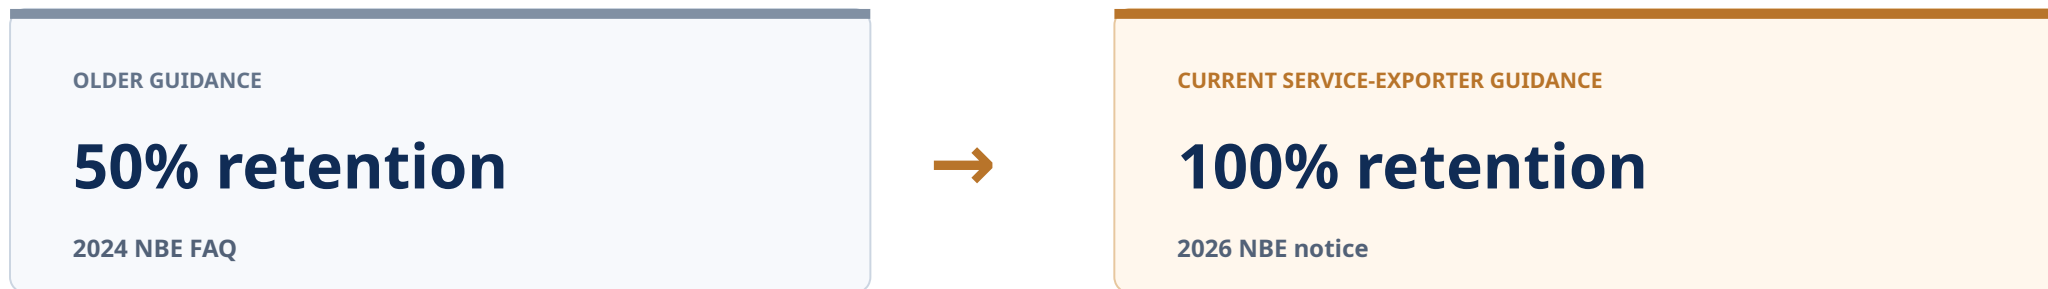

The primary user is a founder or finance lead issuing an invoice or receiving foreign payment for digital services.

- Confirm the current foreign-exchange position
- Prepare the right evidence before tax filing
- Escalate only the unresolved professional question

THE EVIDENCE GAP

An Authentic Source May No Longer State The Current Position

Wayfinder preserves the version trail, then checks the audience and effective date before identifying the applicable position.

Applicability depends on the transaction date and audience.

THE SOLUTION

Wayfinder Connects Evidence, Interpretation, Action, And Judgment

The product separates four information layers so generated reasoning never appears to be official text.

- Verified source evidence with dates and provenance
- Generated interpretation with stated assumptions
- Transaction-specific actions and evidence requirements
- Recorded professional judgment for high-impact questions

THE WORKING PROTOTYPE

A Transaction Becomes A Cited Compliance Checklist

The prototype guides a user from transaction facts to a source-cited action plan through three clear stages.

01

Describe The Transaction

Confirm the service, payment route, date, and business profile.

02

Verify The Current Position

Compare applicable official publications and expose the source trail.

03

Receive The Action Plan

Get required documents, deadlines, and any question held for expert review.

AUTONOMOUS MONITORING

Wayfinder Watch Detects Changes And Preserves Human Control

The operational agent scans administrator-approved sources, fingerprints changes, structures candidate facts, and routes consequential interpretation to people.

- Manual and scheduled live scans
- Configurable official-source registry
- Curator and policy-review queues
- Timestamped run and decision history

TRUST AND SAFETY

Consequential Guidance Cannot Publish Without The Required Review

Foreign exchange, tax, filing, penalty, licensing, conflict, and probable supersession findings remain reviewable.

- No unsupported confidence score
- No unrestricted legal-advice chatbot
- No silent conflict resolution
- Synthetic fixtures remain clearly labeled

SCALE MODEL

Jurisdiction Packs Preserve Local Relevance While Supporting Expansion

The service-export workflow provides the first deep vertical. Goods exports add customs, commodity, logistics, permit, tax, and foreign-exchange evidence.

- Reusable evidence and review architecture
- Local sources and professional reviewers
- English-first interface with multilingual-ready content structures

BUILD AND NEXT STEP

A Working Proof Of Concept Ready For Deeper Validation

The prototype demonstrates the complete path from source monitoring to business action and professional review.

- React and TypeScript frontend
- Vercel Functions and scheduled scans
- Supabase persistence
- Structured AI extraction with deterministic fallback

Role-Based User Guide Available Inside The Product
